

Ruling Depths and Under Keel Clearances - Tay

Vessels are scheduled into / out of ports on the Tay in accordance with the under keel clearance criteria specified in this document and the Marine Guidelines & Port Information. Vessel operators who require increased under keel clearance margins, over and above those published in the Marine Guidelines & Port Information must ensure that these requirements are specified to FTNS at the time of booking the vessel's arrival / departure. This is to ensure that vessels are booked for the correct height of tide, and to ensure that delays / impacts to the shipping schedule are avoided.

Agents are advised to ascertain vessel specific under keel clear requirements prior to making arrival / departure bookings through FTNS.

The following Ruling Depths apply to the berths, ports and approach channels. The depths indicated are the least depth in the channel or on the berth. Deeper water may be available in certain parts of the channel and conversely shallower water may exist just outside of the channel. The depths given below are an indication of the least depth, which maybe encountered in the channel; however a close examination of the latest soundings should be made when preparing a passage plan.

For areas not included in the tables below an under keel clearance of 10% of the vessels maximum draft with a minimum under keel clearance of 0.5m should be used.

1. Data based on a broad interpretation of current surveys and is only intended as a general guide
2. Original surveys should always be consulted; especially for detailed operational planning
3. All Depths quoted are in metres.

All berths at Dundee are dredged boxes. Shoals lie outside these boxes. The depths of which are listed under 'Controlling depth'.

Caution: the table below is a general summary only. Original sounding surveys are to be consulted for navigation and passage planning.
